                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                            The present sequence represents the N-terminal sequence of Tir (see also AAY06220), a novel translocated intimin receptor from an enteropathogenic Escherichia coli (EPEC) strain. The 78 kDa EPEC protein is secreted by the bacterial pathogen. Diagnosis of disease caused by pathogenic E. coli can be performed by use of antibodies that bind to Tir to detect the protein, or the use of nucleic acid probes for detection of nucleic acids encoding Tir. A kit for the detection of Tir-producing E. coli is provided. Also provided are a method of immunising a host with Tir to induce a protective immune response, and a method for screening for compounds which interfere with the binding of bacterial pathogens to

                                                                                                                                                                                                                                                  (EPEC) Strain. The sequence was deduced from an isolated tir (EPEC) strain. The sequence was deduced from an isolated tir polymucleotide (see AAX5885). Tir proteins are secreted by attaching and effacing pathogens such as EPEC and EHEC (see AAX6821) E. coli. The bacterial pathogens insert their own receptors into mammalian cell surfaces, to which the pathogen then adheres to trigger additional host signaling events and actin nucleation. Diagnosis of disease caused by pathogenic E. coli can be performed by use of antibodies that bind to Tir to detect the protein or the use of nucleic acid probes for detection of nucleic acids encoding Tir polypeptide. Isolated Tir nucleic acids, Tir peptides, a recombinant method for producing recombinant Tir, antibodies which bind to Tir, and a kit for the detection of Tir-producing E. coli are provided. A method of immunising a host with Tir to induce a proteins can be used in attenuated E. coli to induce a cell-mediated

A polynucleotide of the invention has anti-bacterial active. The polypepide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterohaemorragic E coli 0157:H7 was determined. The present sequence represents an E. coli 0157:H7-specific polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Enterohemorragic Escherichia coli 0157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell.
                                                                                                                                         gastrointestinal-gen.;

CC identifying adhesin and adhesin-like proteins, by computing the sequence-
CC based attributes of protein sequences using five attribute modules of a
CC neural network software, training an artificial neural network (ANN) for
CC each of the computed five attributes, and identifying the adhesin and
CC equal or greater than 0.51. Also claimed is a set of 274 annotated genes
CC encoding adhesin and adhesin-like proteins, having 274 fully defined 162-
CC 1151 base pair (SEQ ID NO: 385-658) sequences; a set of 105 hypothetical
CC genes encoding adhesin and adhesin-like proteins, having 105 fully
CC defined 306-15876 base pairs (SEQ ID NO: 659-763); a set of 279 annotated
CC gair (SEQ ID NO: 1-279); a set of 105 hypothetical adhesin and adhesin-like proteins, having 279 fully defined 53-3716 base
CC pair (SEQ ID NO: 1-279); a set of 105 hypothetical adhesin and adhesin-like
CC 280-384) sequences; and a fully connected multilayer feed forward ANN (I)
CC based on (MI) (MI) is useful for identifying adhesin and adhesin-like
CC proteins, of therapeutic potential, and identifying and short-listing
CC proteins for further testing in development of new vaccine formulations
CC objections of the proteins of the proteins that are important in drug
CC discovery and preventing therapeutics for whooping cough, pneumonia,
CC distantly related organisms, and from bacteria belonging to a wide
CC unique proteins. The present sequence is a microbial pathogen adhesin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Computational method for identifying adhesin and adhesin like molecules, comprises computing sequence-based attributes of protein sequences using neural network software and training an artificial neural network.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC corresponding polynucleotides. The EspFU polypeptides are EspF-like CC polypeptides encoded by genes of the cryptic prophage CP-933U of CC enterohemorrhagic Escherichia coli (EHEC) or enteropathogenic Escherichia CC coli (EPEC) that binds to a neuronal wiskott-aldrich syndrome protein (N-CC WASP) polypeptide or restores the actin pedestal formation activity of CC enteropathogenic E. coli (EPEC) strain KC12. The invention further CC relates to a method of identifying a candidate compounds capable of Dinding to and/or modulating the activity of EspFU and compounds that CC inhibits protein protein interactions between EspFU and EspFU-interacting proteins such as N-WASP, transducer of Cdc42-dependent actin assembly-1 CC (Toca-1) and p21-activated kinase 1 (Pakl). EspFU polynucleotides are CC useful for treating EHEC infection. The present sequence is the CC enterohemorrhagic Escherichia coli translocated intimin receptor (Tir) protein. This sequence is critical for the formation of actin pedestals of the polynucleotic coli capable of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    signaling events and actin nucleation. Diagnosis of disease caused by pathogenic E. coli can be performed by use of antibodies that bind to Tir to detect the protein or the use of nucleic acid probes for detection of nucleic acids encoding Tir polypeptide. Isolated Tir nucleic acids, Tir peptides, a recombinant method for producing recombinant Tir, antibodies which bind to Tir, and a kit for the detection of Tir-producing E. coli are provided. A method of immunising a host with Tir to induce a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents Tir, a novel translocated intimin receptor (formerly termed H90) from an enterohaemorrhagic Escherichia coli (EHEC) strain. The sequence was deduced from an isolated tir polymucleotide (see AAX58859). Tir proteins are secreted by attaching seffacing pathogens such as EHEC and EPEC (see AAX6620) E. coli. The bacterial pathogens insert their own receptors into mammalian cell surfaces, to which the pathogen then adheres to trigger additional host

This invention relates to a novel plant transcription factor polypeptides, the DNA sequences which encode them and their use in creating transgenic plants. The transgenic plant and methods are us for producing commercially or agriculturally useful plants having improved tolerance to drought, shade and low nitrogen conditions where the producing commercially or agriculturally useful plants having improved tolerance to drought, shade and low nitrogen conditions where the producing commercial plants is a condition of the producing commercial plants.
                                                                                        Example 8; SEQ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Stress tolerant plant-related transcription factor protein SeqID116.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-JUL-2005
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AEA26275 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enhanceutical drugs. The invention insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABP4131-ABP65305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cystes, and dysmenorrhoea), endocrine disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             useful in cancer),

Ovarian antigen polypeptides and CC polynucleotides may also be used in screening for compounds which community in the community of the proposed system disorders. Ovarian antigen expression or activity. The polynucleotides may condulate ovarian antigen expression or activity. The polynucleotides may condulate ovarian antigen expression or activity. The polynucleotides may condulate ovarian antigen of additives or to prepare antibodies conductification of individuals and in forensic analysis, and the complete seguence represents a human ovarian antigen of the invention. Note: The sequence represents a human ovarian antigen of the printed consideration, but was obtained in electronic format directly from WIPO can be proposed to the printed of the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    arthritis, scleroderma, systemic lupus erythematosus, ulcerative colitis, uveitis, etc, a neurological disorder such as epilepsy, stroke, Alzheimer's disease, Huntington's disease, Parkinson's disease, multiple sclerosis, bacterial and viral meningitis, periodic paralysis, mental disorders including mood, anxiety, and schizophrenic disorders, amnesia, diabetic neuropathy, etc, connective tissue disorder such as osteoporosis, Paget's disease, osteonecrosis, osteomyelitis, chondrosarcoma, giant cell tumor, psoriatic arthritis, infectious arthritis, systemic sclerosis, etc, and a cell proliferative disorder such as arthritis, systemic sclerosis, etc, and a cell proliferative disorder such as actinic keratosis, atherosclerosis, hepatitis, psoriasis, cancers including adenocarcinoma, leukemia, lymphoma, melanoma, myeloma, etc. This sequence represents one of the novel proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel isolated human extracellular matrix and cell adhesion molecule (referred to as ECMCAD 1-36), its biologically active or immunogenic fragment or a sequence comprising 90 % identity to ECMCAD 1-36. The molecule is useful for screening a compound for effectiveness as agonist or antagonist of itself. The protein and its encoding nucleic acid are useful in the diagnosis, treatment and prevention of genetic disorder such as addrenoleukodystrophy, Down's syndrome, cystic fibrosis, Gaucher's disease, myotonic dystrophy, sickle cell anemia, thalassemia, Wilms' tumor, etc, immunological disorders such as acquired immunodeficiency syndrome (AIDS), adult respiratory distress syndrome, allergies, anemia, asthma, atherosclerosis, autoimmune hemolytic anemia, contact dermatitis, Goodpasture's syndrome, gout, Grave's disease, multiple expression, osteoporosis, poriasis, rhematoid arthritis, Goldrage, screporosis, automaticia arthritis, Goldrage, screporosis, automaticia arthritis, Goldrage, screporosis, automatorial arthritis, Goldrage, screporosis, automatorial arthritis, Goldrage, screporosis, screporosis, rhematoid arthritis, Goldrage, screporosis, automatorial arthritis, Goldrage, screporosis, screporosis, automatorial arthritis, Goldrage, screporosis, automatorial arthritis, Goldrage, screporosis, scre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Baughn I

                                                                                                                               immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous hocalised neuropathies and central nervous system disease, such as Alzheiner's, Parkinson's disease, Huntington's disease, such as Alzheiner's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activitys such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and c.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          23-DEC-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a polynucleotide for preventing, treating or diagnosing a disease in an individual. The composition or the polypeptide, polynucleotide or RNA precursor, or antibody is useful for diagnosing, preventing or treating diseases (e.g. cell proliferative diseases such as cancer) in an individual. These may also be used for identifying substances capable of binding to or modulating the function of the polypeptide, capable of affecting the function of the corresponding gene, or capable of inhibiting the cell division cycle or cell cycle progression, preferably mitosis and/or meiosis. The present sequence represents an antagonist of cell cycle progression protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New cell cycle progression genes and proteins for modulating cell cycle progression in cells, for preventing, treating or diagnosing cell proliferative diseases (e.g. cancer) or for identifying modulators of

whether a mammal will respond or is responding to an anti-cancer agent CC that modulates cyclin-dependent kinase (cdk) activity. The method CC comprises measuring the level of one or more biomarkers selected from CC 2774 biomarkers given in the specification (nucleotide sequence SEQ ID CN:1246 (Genbank EST W28729) is especially preferred). The method of the CC invention is utilized in a kit for determining or predicting whether CC patient would be susceptible or resistant to treatment by an agent CC modulating cdk activity. The invention also describes a method for CC utilizing individualized genetic profiles for treating diseases and CC disorders based on patient's response and molecular level, specialized against the biomarkers and a cell culture model to identify biomarkers. CC The cdk modulator is preferably N-5-[5-(1,1-Dimethylethyl)-2-CC cazolyl]methyl]thio]-2-thiazolyl-4-piperidine carboxamide, 0.5-L-CC tartaric acid salt. Note: The sequence data for this patent did not form CC cart of the printed specification, but was obtained in electronic format CC sequence represents a biomarker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Biomarkers useful for predicting to a cancer treatment comprising dependent kinase activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to constructing (MI) a strain of diploid fungal CC cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an CC expressible selectable marker and modifying other allele by components. (MI) is useful for constructing a strain of diploid fungal CC cells in which both alleles of a gene are modified. The diploid fungal CC cells having both alleles modified are useful for identifying a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus CC and for identifying a theraspeutic agent for treatment of a mammalian CC activity of a gene product, preferably enzymatic activity, carbon CC compound catabolism, biosynthetic, transporter, transcriptional, CC translational, signal transduction, DNA replication and cell division CC ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of an CC essential Candida albicans protein used in the method of the printed CC specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                   Diagnosing recurrent pregnancy loss comprises examining a mutation and measuring biological activity and express identified to play a role in oocyte development.
                                                                                                     N-PSDB;
                                                                                                                                                                                                           (LEDE/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for determining whether a patient has an increased risk for recurrent pregnancy loss, involving determining whether the formin-2 (Fun-2) gene of the patient has a mutation. The method of the invention is useful for determining whether a patient has a increased risk for recurrent pregnancy loss (RPL/recurrent spontaneous abortion/miscarriage). The sequence represents the murine formin-2 protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining whether patient has increased risk for recurrent loss by determining whether formin-2 (Fmn-2) gene of patient mutation, or by measuring Fmn-2 biological activity or Fmn-2
                                                                                                                                                                                                                                                                     13-APR-2000; 2000US-0196811P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                 capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of diagnosing recurrent pregnancy loss (RPL). The method involves examining formin (Fmn)-2 gene for a mutation and measuring biological activity and expression of Fmn-2, in which decreased levels indicates an increased risk for RPL; or examining the person's formin-2 gene for polymorphisms, in which the presence of a polymorphism indicates an altered risk for RPL. The method is used for diagnosing and treating RPL e.g. in humans. The present sequence is mouse

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Local Similarity
                                       containing functional domains containing functional domain. The new method sequence to, the original target function to be identified. Identification of novel SH3 proteins will be useful for a better understanding of cell growth, malignancy, signal transduction processes, etc. New candidate drugs can be identified, and their specificities (e.g. etc. New candidate drugs can be assessed using the method of the
                                                                                                                                           recognition units. These sequences were used as parts of multivalent recognition unit complexes used in the method of the invention. The method of the invention is for identifying polypeptides containing functional domains of interest (especially SH3 domains). It comprises contacting a multivalent recognition unit (RU) complex with a number of peptides and identifying polypeptides having a selective binding affinity for the RU complex. The method is based on functional similarities and does not rely on sequence similarities. Prior methods only gave limited success for identifying proteins containing an SH3 domain due to the minimal sequence homology among known SH3 proteins. Multivalent RU complexes are particularly suited to screening for polypeptides containing functional domains that are similar to, but not identical in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (CYTO-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Src-homology region 3 domain; human; mouse; SH3 domain; cell growth; cellular signalling element; cellular structural element; malignancy; protein identification; functional domain; protein screening; cellular signal transduction process; binding peptide.

                                                                                                                                                              The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating syndrome associated with ORFX-associated disorder. ORFX polymucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders related to organ organization.
                     transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoprosis, bone degenerative disorders, or periodontal disease, and for gut
                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; SEQ ID NO 16292; 1037pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                    herpesvirus isolate, for example Equine herpesvirus type 1 (EHV-1) or type 4 (EHV-4), which comprises using a genetic marker, especially an ORF30-ml region marker. The invention may be useful for the production of compounds with a virucide activity or for the development of a vaccine. The method, kit and sequence of the EHV-1 strain V592 polymerase ORF30-ml region are useful for assessing the virulence of a herpesvirus or neurovirulence. The vaccine is useful for immunising a host against a herpesvirus disease and for treating disease. The present sequence is that of a peptide which is related to the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides the primary nucleotide sequence of the WSBV genome (AAH62889), predicted transcript sequences (AAH62889) AAH62839) and encoded proteins (AAG64910-AAG88951) and oligonucleotide sequences (AAH62840-63160) suitable for use as primers or probes. The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antivital agents and for monitoring viral gene expression or activity during a treatment regimen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Primary nucleotide sequence of the shrimp white spot Bacilliform virus (WSBV), useful for producing viral polypeptides that can be used to screen for agents that are useful for treating WSBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Shrimp white spot Bacilliform virus; antiviral agent; gene expression; ant transgenic viral resistant shrimp.

P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrochermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigrade. Note: This patent is in the same patent family w0200065062, which contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75920 and AAG66436

Claim 1; SEQ ID NO 21572; 122pp; English.

XX
XX
CC mr invention relates to a recombinant DNA construct comprising a comprising the recombinant DNA construct and a method of producing a comprising the recombinant DNA construct and a method of producing a comprising the recombinant DNA construct and a method of producing a comprising the recombinant DNA construct and a method of producing a comprising the recombinant DNA construct and proving a transformed plant construct and growing the transformed plant where the comprising the transformed plant with the construct and growing the transformed plant where the comprision of property comprises transformed plant properties.

CC improved plant properties, e.g. improved cold, heat or drought tolerance, contensed resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of conducing improved plant proved had plant proved to providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved lighth production or improved galactomannan construct as percents a bacterial polypeptide used in the growth stream of the invention. Note: The sequence heat for this patent did not cormance to the invention. Note: The sequence heat for this patent did not compressed the printered specification but was obtained in electronic conditions.

DNA in order to regulate gene transcription and gene expression plants, in particular Eucalyptus grandis and Pinus radiata. The invention describes DNA constructs containing DNA encoding a transcription factor that regulates the promoter, which is operalinked to the desired nucleic acid to be expressed. It further p

Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a
                                                                                                                                                      This invention relates to novel isolated plant nucleic acid molecules, variants thereof, that encode transcription factors. Specifically, it refers to transcription factor proteins that are capable of binding to

transgenic plants expressing a transcription factor that confers a trait to the plant such as increased drought, salt or disease tolerance, height change, enhanced cold/ frost tolerance, enhanced color, health and nutritional characteristics, as well as improved taste, starch composition, flower longevity and germination, amongst others. Accordingly, such plants that are successfully transfected with a DNA construct can be characterized by a difference in flower color, petal or leaf shape and size, aroma or plant height. This polypeptide is a plant transcription factor protein sequence of the invention.

polynucleotide having any of 5544 nucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences (SEQ ID NO: 5545-11088). The cDNAs and proteins are from corn, soybean, arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising a promoter region functional in a plant cell operably joined to a polynucleotide encoding a polypeptide associated with the property, and growing the transformed plant. The property is selected from improving plant cold tolerance, for manipulating growth rate in plant cells by modification of the cell cycle partners. The invention relates a recombinant DNA construct comprising improving plant drought tolerance, for providing D increased

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                measure of the polymerization of pyrene-G-actin into pyrene-filamentous cactin (pyrene-F-actin) or acrylodan-G-actin into acrylodan-filamentous catin (acrylodan-F-actin). NPFs include Wiskott-Aldrich Syndrome (MASB) protein, a WASP homolog called N-WASP and a family of proteins called suppressor of cAR (SCAR), also referred to as the WASP family verprolin homologous (WAVE) proteins. The SCAR/WAVE family includes SCARI/WAVE1 protein, SCAR2/WAVE2 protein and a SCAR3/WAVE3 proteins and the regulators may be CGc42 protein Racl protein, RhOA protein, RhC protein, Nck2 protein and phosphatidylinositol-1,4-bisphosphate (PIP2). The invention is useful for treating metastatic cancer, autoimmune diseases, cardiovascular and inflammatory diseases and conditions associated with hyperactivity of platelets or increased risk of blood clotting. The present sequence is the Candida abbicans formin useful first the protein used to construct E. coli plasmids which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                           New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improviological characteristics.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC sequences is derived from which organism. Also included is a method of plant with a recombinant DNA construct comprising transforming a complaint with a recombinant DNA construct comprising a polypeptide associated with the property, and growing the transformed company plant. The property is selected from improving plant cold tolerance, for comanipulating growth rate in plant cells by modification of the cell cycle plants, for improving plant drought tolerance, for production of plant growth regulators, for improving plant heat tolerance, for comproving plant tolerance to plant disease, for improving plant heat tolerance, for configuration plant tolerance to pathway, for improving plants, for improving plant tolerance, for conditions, for production for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to pathogens or pests, for yield improvement by modification of compositions, for improving plant tolerance to pathogens or pests, for yield improvement by modification of conditions, for improving plant conditions, for improving plant conditions, for improving plant tolerance to pathogens or pests, for yield improvement by modification of conditions, for improving plant conditions, for improving plant tolerance to pathogens or pests, for yield improvement by modification of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and compositions of the persent invention are useful in the field of plants with improved consents; in particular for producing transgenic plants with improved plant growth in tolerance to extreme osmotic and drought conditions, and improving plant collerance to plant pests or pathogens. They can also be used in physical carays of molecules, plant treased and compositions and improving plant collerance to plant pests or pathogens. They can also be used in physical carays of molecules, plant protein modification, but was obtained in celecting to the printed specification, but was obtained i

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     08-FEB-2002; 2002US-00072851.

                                                                                                                                                                                                                                                                        ABM86049 standard; protein; 899
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                          21-JUN-2002; 2002WO-US019668
                                                                                                   WO2003008540-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 631 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      polynucleotides encoding them. The sequences are useful in diagnosis are therapy of pathological conditions, as molecular targets for diagnostic prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       US6551795-B1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel abiotic stress responsive polynucleotides and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, cashes tress or any of their combinations. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New stress-responsive nucleic acid, useful responsiveness of a plant, e.g. cereal, to stress, salt stress or osmotic stress.
                                                                                                           Venter JC,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL1616-ABL30511), expressed DNA sequences (ABL1619-ABL30511), expressed DNA sequences (ABL1619-BL16175) and the encoded proteins (ABB5737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                        The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa mucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant
                                                                                                                                                                                                                                                                                                                                                   Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                               Disclosure; SEQ ID NO

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an enthod of detecting polynucleotides or polypeptides of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. CC invention further discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polynucleotide probes cand/or monoclonal antibodies for carrying out the methods of the cinvention; methods for the identification of compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767 cc contig sequences corresponding to the cDNA sequences of the invention (ADC1361-ADC1361) and the polypeptides encoded by the contigs (ADC13628) and the polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are calso used for treating diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases, anaemia, platelet concer. The nucleic acids may also be used as hybridisation probes or corrimers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence contains for this patent did not form part of the printed specification, but for with further and the present sequence of the printed specification, but the probability of the probability from wife at the contained in electronic format directly from wife at

                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated purified secreted polynucleotides (SpTM) (1), and the polypeptides (SpTM) encoded by sptm. A polypeptide encoded by (I) is used to identify a compound which binds to it. A microarray comprising (I) is used to generate a transcript. (I) is used to screen a compound for effectiveness in altering expression of (I). (I is used to assess toxicity of a test compound. An agonist or antagonist identified by a new method is used in a pharmaceutical composition. The secretory molecules are used to diagnose or treat conditions, diseases of disorders associated with cell signaling e.g. arteriosclerosis, psoriasis, and cancer. Sequences given in ADI40308-ADI40468 represent human purified secretory polynucleotides of the invention, and those given in ADI40469-ADI40461 represent the polypeptides they encode.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotides and polypeptides are useful developing a diagnostic marker or medicines for expression and activity, or as a target of gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      printed EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel human cDNAs (AEC84246-AEC86688) encoding proteins AEC86689-AEC89131. The cDNAs are useful for analyzing the functions of the proteins, and for developing medicines for diseases e.g. osteoporosis, cancer, inflammation, gastritis, or gastroduodenal ulcer. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from the printed specification but was obtained to the control of the printed specification but was obtained in electronic format directly from the control of the c

    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score
